Problem Minimize the weight of a cylindrical pressure vessel subject to constraints on pressure volume and material thickness

Mathematical Formulation Minimize $f = \rho \pi r^2 h$ Weight Subject to $V = \pi r^2 h \geq V_{req}$ Volume constraint $\sigma = \frac{Pr}{t} \leq \sigma_{allow}$ Stress constraint $r \geq 0, h \geq 0, t \geq 0$ Nonnegativity constraints Where r radius, h height, t thickness, ρ density, P internal pressure, σ_{allow} allowable stress, V_{req} required volume

MATLAB Code Snippet

```
matlab Define objective function
fun = @(x) 2*pi*x(1)^2*x(2)*rho; % rho = 12200; % Density
Define constraints
A = []; b = []; Aeq = []; beq = []; lb = [0; 0; 0]; ub = []; % No upper bounds
Nonlinear inequality constraint
nonlcon = @(x) [x(1)^2*x(2) - Vreq; % Volume constraint
               x(1)*x(2) - sigma_allow]; % Stress constraint
Initial guess
x0 = [1; 1; 1];
Optimization
[xfval, fminconfun, xOpt] = fmincon(fun, x0, A, b, Aeq, beq, lb, ub, nonlcon);
Results
disp('Optimal Radius: ', num2str(xOpt(1)));
disp('Optimal Height: ', num2str(xOpt(2)));
disp('Optimal Thickness: ', num2str(xOpt(3)));
disp('Minimum Weight: ', num2str(xfval));
```

temperature the algorithm accepts all new points that lower the objective but also with a certain probability points that raise the objective by accepting points that raise the objective the algorithm avoids being trapped in local minima and is able to explore globally for more possible solutions an annealing schedule is selected to systematically decrease the temperature as the algorithm proceeds as the temperature decreases the algorithm reduces the extent of its search to converge to a minimum you might need to formulate problems with more than one objective since a single objective with several constraints may not adequately represent the problem being faced if so there is a vector of objectives $f \times f_1 \times f_2 \times \dots \times f_m \times$ that must be traded off in some way the relative importance of these objectives is not generally known until the system's best capabilities are determined and tradeoffs between the objectives fully understood as the number of objectives increases tradeoffs are likely to become complex and less easily quantified the designer must rely on his or her intuition and ability to express preferences throughout the optimization cycle thus requirements for a multiobjective design strategy must enable a natural problem formulation to be expressed and be able to solve the problem and enter preferences into a numerically tractable and realistic design problem
