this is an updated version of the best selling first edition ecological census techniques with updating some new chapters and authors almost all ecological and conservation work involves carrying out a census or survey this practically focussed book describes how to plan a census the practical details and shows with worked examples how to analyse the results the first three chapters describe planning sampling and the basic theory necessary for carrying out a census in the subsequent chapters international experts describe the appropriate methods for counting plants insects fish amphibians reptiles mammals and birds as many censuses also relate the results to environmental variability there is a chapter explaining the main methods finally there is a list of the most common mistakes encountered when carrying out a census

virtually any exercise in ecology will require some knowledge of the techniques for carrying out a census of population numbers this practical text outlines clearly with worked examples the main techniques used

by field ecologists to enumerate plants and animals

wild birds are counted for a wide variety of reasons and by a bewildering array of methods however detailed descriptions of the techniques used and the rationale adopted are scattered in the literature and the newcomer to bird census work or the experienced bird counter in search of a wider view may well have difficulty in coming to grips with the subject as a whole while not an end in itself numerical and distributional census work is a fundamental part of many scientific and conservation studies and one in which the application of given standards is vital if results are not to be distorted or applied in a misleading way this book provides a concise guide to the various census techniques and to the opportunities and pitfalls which each entails the common methods are described in detail and illustrated through an abundance of diagrams showing examples of actual and theoretical census studies anyone with a bird census job to plan should be able to select the method best suited to the study at hand and to apply it to best effect within the limits inherent in it and the constraints of the particular study the royal society for the protection of birds and the british trust for ornithology have for many years pioneered the collaboration of amateurs and professionals in various census studies three members of their staff each with extensive field experience now pool the knowledge of these investigations to lay the groundwork for sound census work in future years
