data clustering is a highly interdisciplinary field the goal of which is to divide a set of objects into homogeneous groups such that objects in the same group are similar and objects in different groups are quite distinct thousands of theoretical papers and a number of books on data clustering have been published over the past 50 years however few books exist to teach people how to implement data clustering algorithms this book was written for anyone who wants to implement or improve their data clustering algorithms using object oriented design and programming techniques data clustering in c exploits the commonalities of all data clustering algorithms to create a flexible set of reusable classes that simplifies the implementation of any data clustering algorithm readers can follow the development of the base data clustering classes and several popular data clustering algorithms additional topics such as data pre processing data visualization cluster visualization and cluster interpretation are briefly covered this book is divided into three parts data clustering and c preliminaries a review of basic concepts of data clustering the unified modeling language object oriented programming in c and design patterns a c data clustering framework the development of data clustering base classes data clustering algorithms the implementation of several popular data clustering algorithms a key to learning a clustering algorithm is to implement and experiment the clustering algorithm complete listings of classes examples unit test cases and gnu configuration files are included in the appendices of this book as well as in the downloadable resources the only requirements to compile the code are a modern c compiler and the boost c libraries

robotic sailing 2017 this book contains the peer reviewed papers presented at the 10th international robotic sailing conference which was organized in conjunction with the 10th world robotic sailing championship held in horten norway the 4th 9th of september 2017 the seven papers cover topics of interest for autonomous robotic sailing which represents some of the most challenging research and development areas the book is divided into two parts the first part contains papers which focus on the design of sails and software for the assessment and predication of sailboat performance as well as software platforms and middleware for sailboat competition and research the second part includes algorithms and strategies for navigation and collision avoidance on local mid and long range the differences in approach in the included papers show that robotic sailing is still an emerging cross disciplinary science the multitude of suggestions to the specific problems of prediction

and simulation of sailboats as well as the challenges of route planning anti grounding and collision avoidance are good indicators of science in its infancy hence we may expect the future to hold great advances for robotic sailing
