What is the primary goal of logistics management? Answer: The primary goal of logistics management is to ensure the efficient and effective movement and storage of goods, services, and related information from the point of origin to the point of consumption, in order to meet customer requirements at the lowest total cost. This involves coordinating transportation, inventory, warehousing, packaging, and information flow to optimize supply chain performance. 2. Define the term 'supply chain management' and explain its relationship with logistics. Answer: Supply chain

management (SCM) is the strategic coordination and management of all activities involved in sourcing, procurement, conversion, and logistics management. It encompasses the planning and management of all supply chain activities to maximize customer value and achieve a sustainable competitive advantage. Logistics is a subset of SCM focused specifically on the movement, storage, and distribution of goods within the broader supply chain framework.

Packaging: Protecting products during transit and storage.

Information Flow: Coordinating data exchange for smooth operations.

5. Explain the concept of 'Just-in-Time' (JIT) inventory and its advantages and disadvantages.

Answer: JIT is an inventory management strategy that aims to reduce inventory holding costs by receiving goods only as they are needed in the production process. This approach minimizes storage requirements and waste.

Advantages: Reduces inventory holding costs. Improves cash flow. Enhances product quality by emphasizing process improvements.

Disadvantages: 3 Requires highly reliable suppliers and transportation. Vulnerable to supply chain disruptions. May lead to production delays if supply is interrupted.

6. Describe the difference between 'push' and 'pull' logistics systems.

Answer: Push System: Production and distribution are based on forecasted demand. Goods are 'pushed' through the supply chain to the market. This can lead to excess inventory or stockouts if forecasts are inaccurate.

Pull System: Production and distribution are driven by actual customer demand. Goods are 'pulled' through the supply chain, reducing excess inventory and

aligning supply closely with demand. 7. What is reverse logistics, and why is it important? Answer: Reverse logistics involves the process of moving goods from their final destination back to the manufacturer or appropriate disposal site. It includes activities like returns, recycling, remanufacturing, and disposal.
