the invention of semiconductor devices is a fairly recent one considering classical time scales in human life the bipolar transistor was announced in 1947 and the mos transistor in a practically usable manner was demonstrated in 1960 from these beginnings the semiconductor device field has grown rapidly the first integrated circuits which contained just a few devices became commercially available in the early 1960s immediately thereafter an evolution has taken place so that today less than 25 years later the manufacture of integrated circuits with over 400 000 devices per single chip is possible coincident with the growth in semiconductor device development the literature concerning semiconductor device and technology issues has literally exploded in the last decade about 50 000 papers have been published on these subjects the advent of so called very large scale integration vlsi has certainly revealed the need for a better understanding of basic device behavior the miniaturization of the single transistor which is the major prerequisite for vlsi nearly led to a breakdown of the classical models of semiconductor devices

this volume reviews in the context of partial differential equations algorithm development that has been specifically aimed at computers that exhibit some form of parallelism emphasis is on the solution of pdes because these are typically the problems that generate high computational demands the authors discuss architectural features of these computers inasmuch as they influence algorithm performance and provide insight into algorithm characteristics that allow effective use of hardware

first published in 2018 this book is devoted to the description of the basic principles of x ray diffraction on noncrystalline systems and to the correlation between diffracted intensities and structure it presents a critical comparison between the results obtained by xrd and the ones obtained by neutron diffraction

elliptic problem solvers provides information pertinent to some aspects of the numerical solution of elliptic partial differential equations this book presents the advances in developing elliptic problem solvers and analyzes their performance organized into 40 chapters this book begins with an overview of the approximate solution of using a standard galerkin method employing piecewise linear triangular finite elements this text then defines the types of vector architecture and discusses the variation in performance that can occur on a vector processor as a function of algorithm and implementation other chapters consider the implementation of techniques for elliptical problems this book discusses as well the six techniques for the solution of nonsymmetric linear systems arising from finite difference discretization of the convection diffusion equation the final chapter deals with the basic semiconductor device equations this book is a valuable resource for electrical and computer engineers scientists computer programmers pure mathematicians and research workers

trends in the theory and practice of non linear analysis

contains research articles on the development and analysis of numerical methods including their convergence stability and error analysis as well as related results in functional analysis and approximation theory computational experiments and new types of numerical applications are also included

this volume presents an account of some of the most important work that has been done on various research problems in the theory of polynomials of one and several variables and their applications it is dedicated to p l chebyshev a leading russian mathematician

these proceedings collect the major part of the lectures given at enu math2003 the european conference on numerical mathematics and ad vanced applications held in prague czech republic from 18 august to 22 august 2003 the importance of numerical and computational mathematics and sci entific computing is permanently growing there is an increasing number of different research areas where numerical simulation is necessary let us men tion fluid dynamics continuum mechanics electromagnetism phase transi tion cosmology medicine economics finance etc the success of applications of numerical methods is conditioned by changing its basic instruments and looking for new appropriate techniques adapted to new problems as well as new computer architectures the enumath conferences were established in order to provide a fo rum for discussion of current topics of numerical mathematics they seek to convene leading experts and young scientists with special emphasis on con tributions from europe recent results and new trends are discussed in the analysis of numerical algorithms as well as in their applications to challenging scientific and industrial problems the first enumath conference was organized in paris in 1995 then the series continued by the conferences in heidelberg 1997 jyvaskyla 1999 and ischia porto 2001 it was a great pleasure and honour for the czech numerical community that it was decided at ischia porto to organize the enumath2003 in prague it was the first time when this conference crossed the former iron courtain and was organized in a postsocialist country
