phenomenology of diesel combustion and modeling diesel is the most efficient combustion engine today and it plays an important role in transport of goods and passengers on land and on high seas the emissions must be controlled as stipulated by the society without sacrificing the legendary fuel economy of the diesel engines these important drivers caused innovations in diesel engineering like re entrant combustion chambers in the piston lower swirl support and high pressure injection in turn reducing the ignition delay and hence the nitric oxides the limits on emissions are being continually reduced the fore the required accuracy of the models to predict the emissions and efficiency of the engines is high the phenomenological combustion models based on physical and chemical description of the processes in the engine are practical to describe diesel engine combustion and to carry out parametric studies this is because the injection process which can be relatively well predicted has

the dominant effect on mixture formation and subsequent course of combustion the need for improving these models by incorporating new developments in engine designs is explained in chapter 2 with model based control programs used in the electronic control units of the engines phenomenological models are assuming more importance now because the detailed cfd based models are too slow to be handled by the electronic control units experimental work is necessary to develop the basic understanding of the processes

this book will interest researchers scientists engineers and graduate students in many disciplines who make use of mathematical modeling and computer simulation although it represents only a small sample of the research activity on numerical simulations the book will certainly serve as a valuable tool for researchers interested in getting involved in this multidisciplinary field it will be useful to encourage further experimental and theoretical researches in the above mentioned areas of numerical simulation

this work contains the proceedings of the distillation and absorption conference which happens every 5 years this collection of 100 contributions spanning 23 countries showcase the newest and best distillation and absorption technologies which cover a broad range of fundamental and applied aspects of the technology to address these aspects the contributions have been put into seven themes modelling and simulation steady state dynamic and cfd energy efficiency and sustainability equipment design and operation integrated hybrid and novel processes process troubleshooting and handling operational problems control and operation and basic data
